4.3.2.1	(a)	7
4.3.2.2	(b)	8
4.3.2.3	(c)	8
4.3.2.4	(d)	8
4.3.2.5	(e)	8
4.3.2.6	(f)	8
4.4	LE4C: Support Vector Machine, 2 points total	9
4.4.1	LE4C: ISLR 12.8 Principal Components Analysis (1 point)	9
4.4.1.1	(a) Data Preparation	9
4.4.1.2	(b) SVM	9
4.4.1.3	(c) ROC curve and predictions	9

LE4, in 4 parts (A, B, C, D)

Details

- Due Tuesday, March 1st
 - At 11:59 p.m.
- The grading is done on how you show your thinking,
 - explain yourself and
 - show your R code and
 - the output you got from your code.
- Code style is important
 - Follow Rstudio code diagnostics notices
 - And the [Google R Style Guide](#)

LE4 Points

- LE4A: 2 points total
- LE4B: 2 points total
- LE4C: 2 points total
- LE4D: 2 points total (in a separate file because requires GPUs on Markov)
 - 0.5 point Code Style
 - **0.5 Set your primary linux group to be DSCI33-4453**

To be done as an Rmd file,

- where you turn in
 - the Rmd file and
 - the compiled pdf showing your work.

You will want to produce a report type format

- (html and pdf type document) to turn in.
- And not an ioslides or beamer (slide type) compiled output.
 - These are presentation formats, and can be fussy

Are **you backing up your git repo**

- in a second and third location,
 - to avoid corruption problems?
-

4.1 LE4: Set Your Primary Linux Group To Course Group, 0.5 points total

To avoid us all getting “Quota Locked Out”

- as we move to Machine Learning and Deep Learning
 - With Neural Networks
- Its important everyone has their primary Linux Group
 - Set to be `dsci353_353m_453`

To do this you need to login to <https://amara.case.edu>

- Using your CaseID and your pwd (password)
- And then locate the section for
 - **Cluster Storage Group**

Some background info on your Cluster Storage Group

- This table lists the storage groups that you belong to across all clusters,
 - So the Markov Data Science Cluster,
 - And the Rider (RHEL7) and Pioneer (RHEL8) compute clusters
 - including the quota and current usage.
- Your default group will be used to create files (and accrue quota usage)
 - if you do not explicitly change groups using the `newgrp` command.

Under Cluster Storage Group you should see two or more choices

- You should see `rx131-software`
 - This gives you access to our OnDemand Containerized Apps
- And you should see `dsci353_353m_453`

So in your CaseID account's Amara settings

- Your Cluster Storage Group **Should Be `dsci353_353m_453`**

- If it isn't then select the radio button
 - next to `dsci353_353m_453`

When done successfully, You should see this in Amara

The screenshot shows the Amara2 web interface in a Mozilla Firefox browser. The address bar shows `https://ondemand-pioneer.case.edu/pun/sys/dashboard/noVNC-1.1.0/vnc.html?utf8=✓&autoconnect=true&path=rn`. The page title is "Amara2 — Mozilla Firefox". The browser tabs show "Amara2". The address bar shows `https://amara2.case.edu` with a 80% zoom level. The page content includes the Amara logo and a green "D" button. The main content area displays three sections:

Compute Cluster - Pioneer ?

Default ?	Name ?	ID ?	CPUs ? (R/PD/Quota)	GPUs ? (R/PD/Quota)	WallTime ?
<input checked="" type="radio"/>	dsci353_353m_453	dsci353_353m_453	24/0/256	2/0/12	01d 12h:00m

Compute Cluster - Rider/Markov ?

Default ?	Name ?	ID ?	CPUs ? (R/PD/Quota)	GPUs ? (R/PD/Quota)	WallTime ?
<input checked="" type="radio"/>	dsci353_353m_453	dsci353_353m_453	32/0/256	0/0/12	01d 12h:00m

Cluster Storage ?

Default ?	Name ?	ID ?	Home ? (Used/Quota)	Scratch ? (Used/Quota)	Research Storage ? (Used/Quota)	Dedicated Storage ? (Used/Capacity)
<input checked="" type="radio"/>	dsci353_353m_453	dsci353_353m_453	91/920 G	5/1000 G		
<input type="radio"/>	rx131_software	rx131_software	441/920 G	5/1000 G		

Figure 1: Successful setting of Cluster Storage Group

Now launch an SDLE-Diagnostics OnDemand App

- from <https://ondemand.case.edu>
- And in SDLE-Diagnostics
 - On the first screen ("User Diagnostics")
- You should see GREEN box, stating
 - `dsci353_353m_453`
 - "Your primary group is correct!"

Now you won't be the cause of us all getting

- Quota Lockout, as we move forward this semester.

4.2 LE4A: ISLR2 Chapter 7: Moving Beyond Linearity, 2 points total

4.2.1 LE4A: ISLR2 7.7, 0.5 point

In this exercise, you will further analyze the *Wage* data set considered throughout this chapter.

The *Wage* data set contains a number of other features

- not explored in this chapter,
- such as marital status (`maritl`), job class (`jobclass`),
- and others.

Explore the relationships between some of these other predictors and wage,

- and use non-linear fitting techniques
- in order to fit flexible models to the data.

Use the `deviance()` function to evaluate the accuracy of the model fits.

```
# Put your code here, with comments and good style and syntax  
library(ISLR2)  
library(gam)
```

```
## Loading required package: splines
```

```
## Loading required package: foreach
```

```
## Loaded gam 1.22-1
```

```
# Firstly, load the data
```

```
# draw some plots to see the relationship between each factor and the response:
```

```
# Now make a number of gam models with different predictors
```

```
# Do ANOVA tests to find out best model:
```

```
# Find the deviance of each model
```

```
# Find the smallest deviance
```

```
# Make the plot to visualize
```

1. What is the number output telling you?

- Is this value absolute or relative?
- Is it meaningful on its own?

ANSWER:

2. Why can't we fit splines with variables like `maritl` and `jobclass`?

ANSWER:

- Why is the `predict` function unable to generate values?

ANSWER:

3. What did you find was the best model for predicting wage?

ANSWER:

4.2.2 LE4A Continued: ISLR2 7.9 1.5 point

This question uses the variables

- `dis` (the weighted mean of distances to five Boston employment centers)

- and `nox` (nitrogen oxides concentration in parts per 10 million)
- from the `Boston` data.

We will treat `dis` as the predictor and `nox` as the response.

4.2.2.1 (a) Use the `poly()` function to fit a cubic polynomial regression

- to predict `nox` using `dis`.

Report the regression output,

- and plot the resulting data and polynomial fits.
- using `ggplot2`

ANSWER:

4.2.2.2 (b) Plot the polynomial fits for a range of different polynomial degrees

- (say, from 1 to 10),
- and report the associated residual sum of squares.

```
# Put your code here, with comments and good style and syntax
# Make the fitting models from 1 to 10
```

```
# Make the plots
```

```
# Make ANOVA Analysis
```

```
# Store the RSS
```

ANSWER: ##### (c)

Perform cross-validation or another approach

- to select the optimal degree for the polynomial,
- and explain your results.

```
# Put your code here, with comments and good style and syntax
```

ANSWER:

4.2.2.3 (d) Use the `bs()` function to fit a regression spline

- to predict `nox` using `dis`.

Report the output for the fit

- using four degrees of freedom.

How did you choose the knots?

Plot the resulting fit, using `ggplot2`.

```
# Put your code here, with comments and good style and syntax
library(splines)
```

```
# fit a model
```

```

# summary of your model

# visualize your model

# knots chosen:

# Plot with the knots added, use base plot as a comparison to ggplot

# Predict based on model

# Plot, including 2-se confidence interval

# Add knots to your plot, to visualize them

```

ANSWER:

4.2.2.4 (e) Now fit a regression spline for a range of degrees of freedom,

- and plot the resulting fits
- and report the resulting RSS.

Describe the results obtained.

```

# Put your code here, with comments and good style and syntax

# fit models

# Summary of the model

# knots chosen:

# ANOVA and RSS calculation

# Visualize

# Predict based on model

# Plot, including 2-se confidence interval

# Draw the graph to choose

```

ANSWER:

4.2.2.5 (f) Perform cross-validation or another approach

- in order to select the best degrees of freedom
- for a regression spline on this data.

Describe your results.

```
# Put your code here, with comments and good style and syntax
```

ANSWER:

4.3 LE4B: ISLR2 Chapter 8: Tree-Based Methods, 2 points total

4.3.1 LE4B: ISLR2 8.7, 0.5 point

In the lab, we applied random forests to the Boston data

- using `mtry = 6` and using `ntree = 25` and `ntree = 500`.

Create a plot displaying the test error resulting from

- training random forest models on this data set
- for a more comprehensive range of values for `mtry` and `ntree`.

You can model your plot after Figure 8.10.

```
# Put your code here, with comments and good style and syntax  
library(randomForest)
```

```
## randomForest 4.7-1.1
```

```
## Type rfNews() to see new features/changes/bug fixes.
```

Describe the results obtained.

ANSWER:

4.3.2 LE4B Continued: ISLR2 8.8, 1.5 points

In the lab, a classification tree was applied to the `Carseats` data set

- after converting `Sales` into a qualitative response variable.

Now we will seek to predict `Sales` using regression trees and related approaches,

- treating the response as a quantitative variable.

4.3.2.1 (a) Split the data set into a training set and a test set.

```
# Put your code here, with comments and good style and syntax  
library(ISLR2)  
library(ggplot2)
```

```
##
```

```
## Attaching package: 'ggplot2'
```

```
## The following object is masked from 'package:randomForest':
```

```
##
```

```
## margin
```

4.3.2.2 (b) Fit a regression tree to the training set.

- Plot the tree,
- and interpret the results.

```
# Put your code here, with comments and good style and syntax  
library(tree)
```

What test MSE do you obtain?

ANSWER:

4.3.2.3 (c) Use cross-validation in order to determine the optimal level of tree complexity.

Does pruning the tree improve the test MSE?

ANSWER:

```
# Put your code here, with comments and good style and syntax
```

4.3.2.4 (d) Use the bagging approach in order to analyze this data.

What test MSE do you obtain?

ANSWER:

Use the `importance()` function

- to determine which variables are most important.

```
# Put your code here, with comments and good style and syntax
```

ANSWER:

4.3.2.5 (e) Use random forests to analyze this data.

```
# Put your code here, with comments and good style and syntax
```

What test MSE do you obtain?

ANSWER:

Use the `importance()` function

- to determine which variables are most important.

Describe the effect of m ,

- the number of variables considered at each split,
- on the error rate obtained.

```
# Put your code here, with comments and good style and syntax
```

ANSWER:

4.3.2.6 (f) The BART package is for Bayesian Additive Regression Trees

- discussed in section 8.2.4.

Now analyze the data using BART,

- and report your results.

ANSWER:

4.4 LE4C: Support Vector Machine, 2 points total

4.4.1 LE4C: ISLR 12.8 Principal Components Analysis (1 point)

The Water Potability dataset is available here: <https://www.kaggle.com/datasets/adityakadiwal/water-potability>,

It is a dataset that - records the potability (whether the water can be drunk) - and the related variables

4.4.1.1 (a) Data Preparation

- Read the data from the file, and separate into training and testing data (70%/30%)
- Eliminate the missing data
- Standardize the data (exclude the Potability response) by using scale() function.
- Calculate the Point-biserial correlation coefficient (for variables and the response “Potability”)
- Then draw the plot to describe the data.
- What are the results of the correlations?

```
# Read the data
rawdata <- read.csv("data/water_potability.csv")
# Eliminate the missing data
data <- na.omit(rawdata)
# Standardize the data

# Training and testing

# point-biserial correlation
```

ANSWER:

4.4.1.2 (b) SVM Now, we use support vector machine to train the model - By using different kernel functions - Try different kernel functions (linear, radial, polynomial, etc) - Select the best kernel functions and made the predictions (With the Confusion Matrix for each cases)

ANSWER:

4.4.1.3 (c) ROC curve and predictions After choosing the kernel function, draw the ROC curve - What is the accuracy of your model? - Choose the threshold to determine whether the water should be used for drink or not

```
# Thus the best kernel here is radial, which accuracy is:
```

Answer:
