

# Introduction to Deep Learning

Charles Ollion - Olivier Grisel

Olivier Grisel, Charles Ollion, Institut Polytechnique de Paris  
<https://github.com/m2dsupsdclass/lectures-labs>

# Goal

## Overview

- When and where to use DL
- "How" it works
- Frontiers of DL

# Goal

## Overview

- When and where to use DL
- "How" it works
- Frontiers of DL

## Arcana of DL

- Implement using Numpy, and Tensorflow (Keras)
- Engineering knowledge for building and training DL

# What is Deep Learning

Good old Neural Networks, with more layers/modules

Non-linear, hierarchical, abstract representations of data

Flexible models with any input/output type and size

Differentiable Functional Programming

# Why Deep Learning Now?

- Better algorithms & understanding
- Computing power (GPUs, TPUs, ...)
- Data with labels
- Open source tools and models

# Why Deep Learning Now?

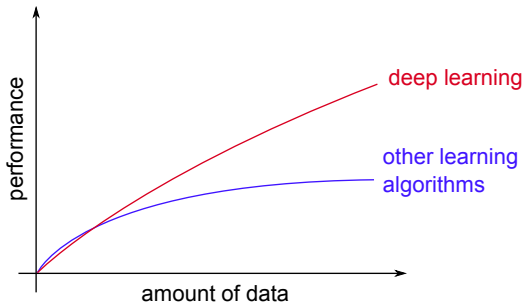

- Better algorithms & understanding
- Computing power (GPUs, TPUs, ...)
- Data with labels
- Open source tools and models

*GPU and TPU*

# Why Deep Learning Now?

- Better algorithms & understanding
- Computing power (GPUs, TPUs, ...)
- Data with labels
- Open source tools and models

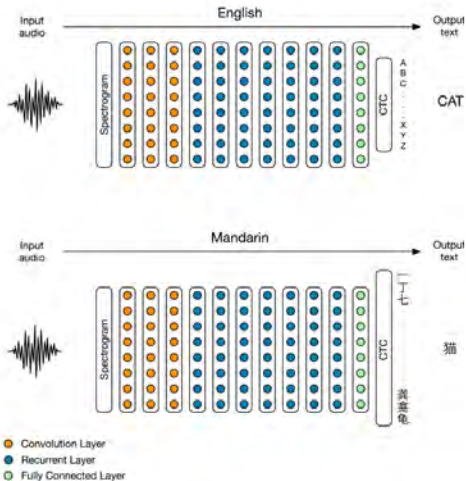

# Why Deep Learning Now?

- Better algorithms & understanding

# DL Today: Generative models

# DL Today: Generative models

Guess which one is generated?

Two horizontal sliders for audio comparison. Each slider has a dark bar on the left and a vertical line indicating the current position. To the right of each slider is a vertical ellipsis icon.

# Frameworks and Computation Graphs

# Libraries & Frameworks

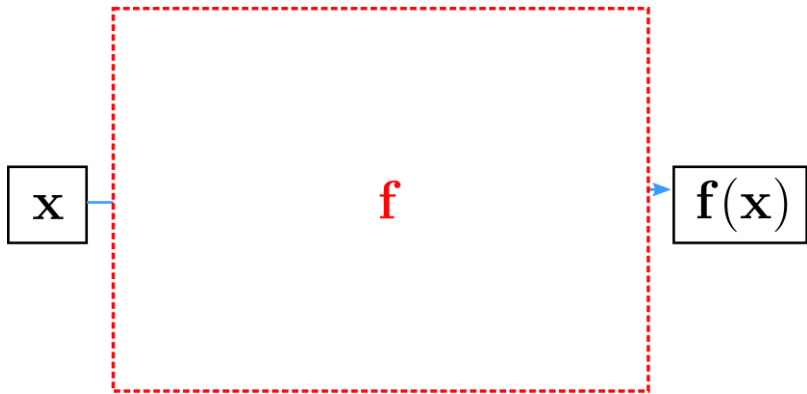

This lecture is using **Keras**: high level frontend for **TensorFlow** (and MXnet, Theano, CNTK)

-----  
Theano, CNTK, Caffe2 don't exist anymore

Caffe2 merged into PyTorch

mxnet is an Apache Software Foundation Open Source Project

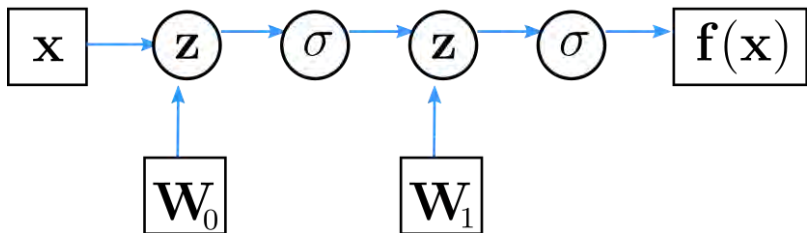

# Computation Graph

Neural network = parametrized, non-linear function

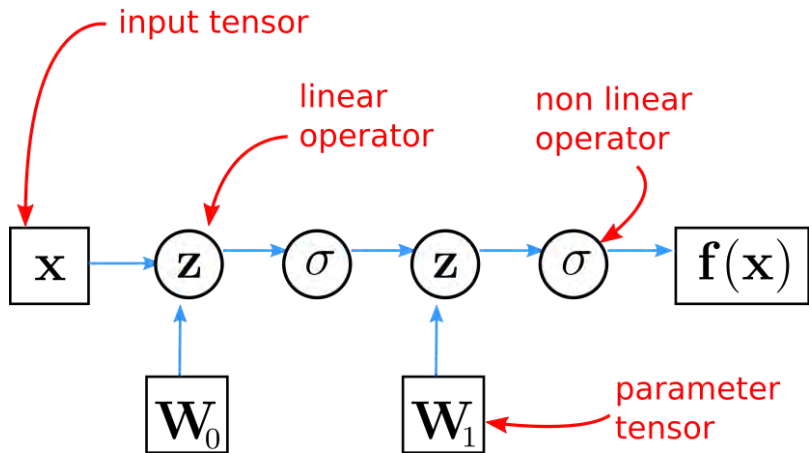

# Computation Graph

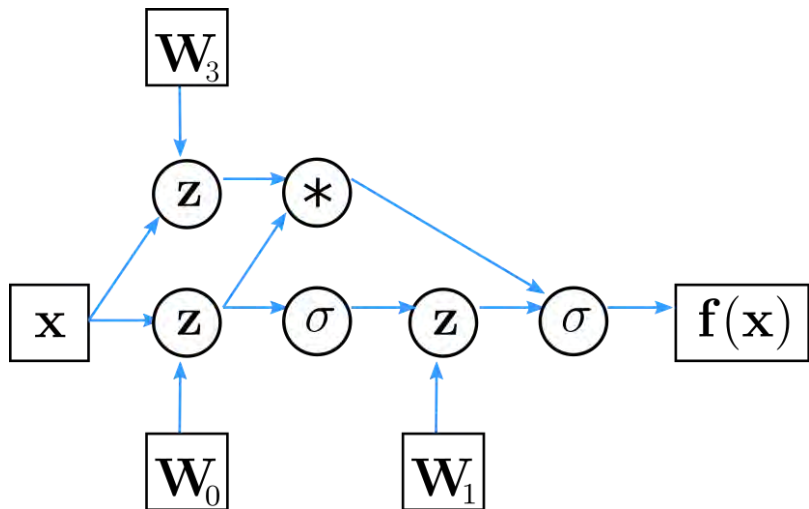

Computation graph: Directed graph of functions, depending on parameters (neuron weights)

# Computation Graph

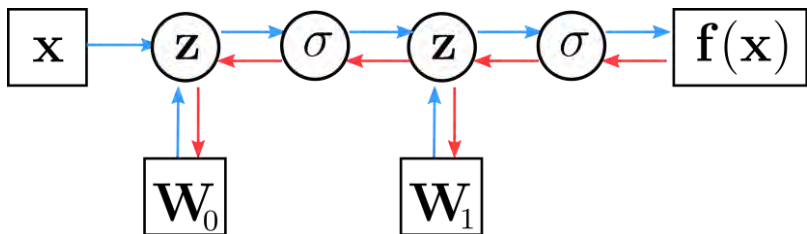

Combination of linear (parametrized) and non-linear functions

# Computation Graph

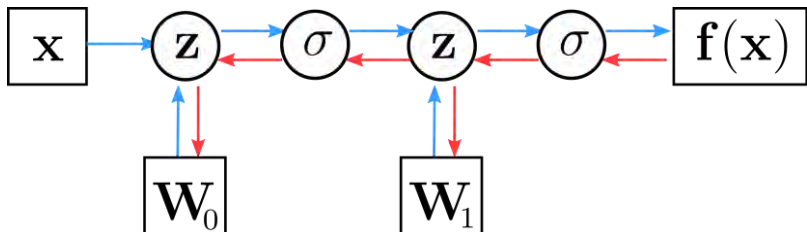

Not only sequential application of functions

# Computation Graph

Automatic computation of gradients: all modules are **differentiable**!

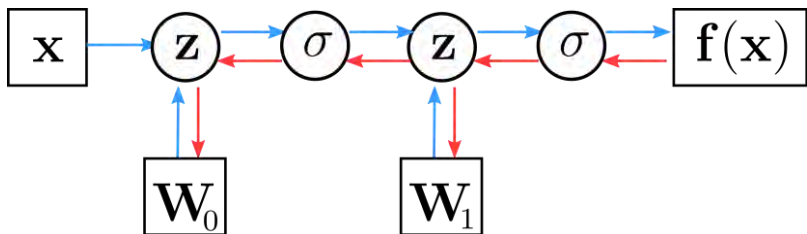

# Computation Graph

Automatic computation of gradients: all modules are **differentiable**!

Theano (now Aesara), **Tensorflow 1**, etc. build a static computation graph via static declarations.

# Computation Graph

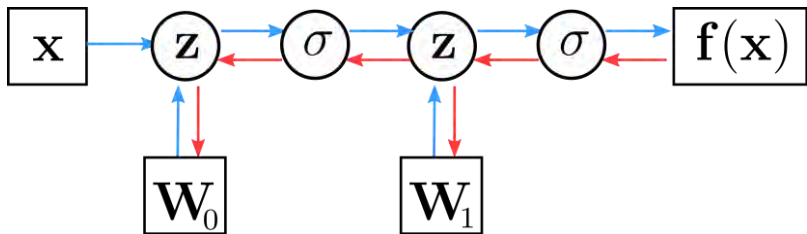

Automatic computation of gradients: all modules are **differentiable**!

Theano (now Aesara), **Tensorflow 1**, etc. build a static computation graph via static declarations.

**Tensorflow 2**, **PyTorch**, **JAX**, etc. rely on dynamic differentiable modules: "define-by-run".

# Computation Graph

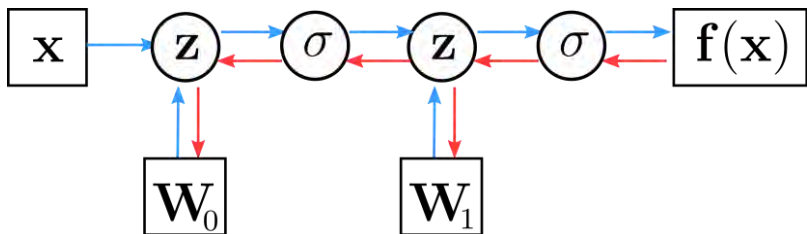

Automatic computation of gradients: all modules are **differentiable**!

Theano (now Aesara), **Tensorflow 1**, etc. build a static computation graph via static declarations.

**Tensorflow 2**, **PyTorch**, **JAX**, etc. rely on dynamic differentiable modules: "define-by-run".

Vector computation on **CPU** and accelerators (**GPU** and **TPU**).

# Computation Graph

## Simple keras implementation

```
model = Sequential()  
model.add(Dense(H, input_dim=N)) # defines  $W_0$   
model.add(Activation("tanh"))  
model.add(Dense(K)) # defines  $W_1$   
model.add(Activation("softmax"))
```
